An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.

A rocket engine uses stored rocket propellants as the reaction mass for forming a high-speed propulsive jet of fluid, usually high-temperature gas. Rocket engines are reaction engines, producing thrust by ejecting mass rearward, in accordance with Newton's third law. Most rocket engines use the combustion of reactive chemicals to supply the necessary energy, but non-combusting forms such as ...

Abstract The combustion properties of torrefied mixture of empty fruit bunch (EFB) and polyethylene (PE) plastics were investigated experimentally, for weight ratio of 95:5 (EFB: PE) and 90:10. The mixture samples were obtained from briquettes that were produced under various briquetting temperatures (150°C-190°C). The torrefaction was performed at constant temperature of 250°C and at ...
